Part 2 — Deploy the Automation & Connect Stripe

STEP-BY-STEP · WHERE · WHAT · HOW · JUNE 2026
CONFIDENTIAL — FOR DR. RER. NAT. DESIREE GRUBER

What you're doing here

~25 minutes

Two jobs: **(A)** install the automation "engine" inside your **Auralis CRM** spreadsheet and publish it as a web address, and **(B)** tell **Stripe** to call that address whenever someone pays. After this, a payment automatically creates the client's folder, files their intake, and sends the emails — you only approve the report and run the call.

HAVE THESE READY

- The **Auralis CRM** spreadsheet open in a browser tab.
- The engine code: open `github.com/stefangruber001/AuralisNatura` → branch **v2-automation** → `automation/apps-script/Code.gs`. (Or just ask me in chat and I'll paste the whole code for you.)
- Your **Stripe** dashboard login.

Deploy the Apps Script

1 Open the script editor AURALIS CRM SHEET

1. Open your **Auralis CRM** spreadsheet.
2. Top menu → **Extensions** → **Apps Script**. A new tab opens with a file called `Code.gs`.

2 Paste the engine code APPS SCRIPT

1. **Select all** existing content in the editor (Ctrl/⌘+A) and delete it.
2. Open the `Code.gs` from GitHub (path above), click the **Raw** button, select all, copy.
3. Paste it into the Apps Script editor.
4. Click the **Save** icon. Rename the project (top-left, "Untitled project") to `Auralis Engine`.

Already filled for you: your folder ID, CRM ID, intake form link and Calendar booking link are in the code. You don't need to edit those.

3 Check one setting APPS SCRIPT · TOP OF CODE

Near the top you'll see `CRM_TAB: 'CRM'`. Make sure `'CRM'` matches the name of the tab in your spreadsheet that holds the columns (Timestamp, Name, Email...). If your tab is named differently, change the text between the quotes to match, then Save.

4 Add the secret webhook token APPS SCRIPT · PROJECT SETTINGS

1. Left sidebar → ⚙️ **Project Settings**.
2. Scroll to **Script Properties** → **Add script property**.
3. **Property:** `WEBHOOK_TOKEN`
4. **Value:** invent a long random string (32+ characters, letters & numbers, no spaces). Example pattern: `an_9f3Kq7Lp2Xc8Vb4Nz6Rw1Ty5Hs0Md` — make your own and **keep a copy**; you'll paste it into Stripe in Part B.
5. Click **Save script properties**.

Why: Google scripts can't read Stripe's signature header, so this secret token is what proves a request really came from your Stripe. Treat it like a password.

5 Authorise & create the intake trigger APPS SCRIPT · EDITOR

1. Back in the editor, in the function dropdown (top toolbar) choose `setupTriggers`.
2. Click ► **Run**.
3. A Google permissions dialog appears → **Review permissions** → choose your account → "Google hasn't verified this app" → **Advanced** → **Go to Auralis Engine (unsafe)** → **Allow**. (This is your own script; it's safe.)
4. When it finishes you'll see a confirmation. This links the **intake form** → **spreadsheet** automation.

Important: the intake Google Form must be set to send responses to *this* spreadsheet (Form → Responses → Link to Sheets → the Auralis CRM).

6 Publish as a Web App (the address Stripe will call) APPS SCRIPT

1. Top-right → **Deploy** → **New deployment**.
2. Click the ⚙ **gear** next to "Select type" → choose **Web app**.
3. **Description:** `Stripe webhook`
4. **Execute as:** **Me** (your email).
5. **Who has access:** **Anyone**. (Required so Stripe can reach it. It's protected by your secret token.)
6. **Deploy** → authorise again if asked → **copy the Web app URL** (looks like `https://script.google.com/macros/s/AKfy.../exec`). Keep it for Part B.

Point Stripe at your web app

7 Make sure payments collect name & email STRIPE · PAYMENT LINKS

1. Stripe Dashboard → **Payment Links** → open each of your three product links.
2. Confirm the checkout collects **customer name and email** (Stripe collects email by default; enable "Collect customers' names" if it's off).

Why: the automation reads the buyer's name + email from the payment to create their folder and send their welcome email.

8 Add the webhook endpoint STRIPE · DEVELOPERS

1. Make sure you're in the same mode as your Payment Links — **Test/Sandbox** for now (toggle top-right of Stripe).
2. Go to **Developers** → **Webhooks** → **Add endpoint** (or + **Add destination**).
3. **Endpoint URL:** paste your Web app URL and add `?token=` followed by your secret token. The full thing looks like:

```
https://script.google.com/macros/s/AKfy.../exec?token=YOUR_WEBHOOK_TOKEN
```

(Replace `AKfy...` with your real URL and `YOUR_WEBHOOK_TOKEN` with the exact token from Step 4.)

9 Choose the event & save STRIPE · WEBHOOKS

1. **Select events to listen to** → search and tick `checkout.session.completed`.
2. Click **Add endpoint** to save.

10 Test it end-to-end STRIPE → YOUR SHEET

1. Open one of your Payment Links and complete a **test payment** (Stripe test card `4242 4242 4242 4242`, any future date, any CVC, your own email).
2. Within a few seconds check your **Auralis CRM** sheet: a new row should appear with status **Paid**, a client folder + report Doc linked, and a welcome email in that inbox.
3. If nothing appears: in Apps Script → **Executions** (left sidebar) check for errors; and in Stripe → the webhook → **recent deliveries** confirm it shows `200`. A `401` means the token in the URL doesn't match Step 4.

WHEN YOU'RE DONE — SEND ME TWO THINGS

1. The **Web app URL** worked? Just say "deployed ✓" (you don't need to share the URL or token — keep those private).
2. If you'd like, the **report template Doc ID** — though I'll create that Doc for you once you approve the Google Drive permission.

GOING LIVE LATER

When you're ready to take real payments, switch Stripe to **Live** mode and repeat Steps 8–9 there (Live mode has its own webhooks). Use the same Web app URL + token.
